### 3. Summary

The Opinaca-Wildcat Gold Project lies immediately east and north of the Eleonore gold discovery to the northeast of Opinaca Reservoir in the James Bay area of Québec. The project includes two intricate groups of claim blocks which differ in their ownership as follows: (1) the Wildcat group includes eight claim blocks that are 100% held by Everton, whereas (2) the four claim blocks of the Opinaca group are subject to an option agreement by which Everton may acquire a 50% interest. In 2007, new claims (CDC) were added to the land package, which now covers a total area of 786 km<sup>2</sup>.

These properties straddle the contact between the Opinaca and LaGrande subprovinces of the Archean-aged Superior Craton. Rock units are dominated by biotite quartzo-feldspathic metasedimentary rocks of the LaGuiche Group which are invariably intruded by simple white pegmatite. Other rock units include amphibolites and sulphidic paragneiss. However, the latter remain minor units and appear as tabular or lenticular bodies concordant with the regional foliation.

Several gold occurrences in bedrock were discovered following exploration work performed by Everton since 2005 within the project area (Inex, Manuel and Claude). Lithochemical sampling undertaken in 2007 added two new occurrences, namely the Charles and Dominic targets. Gold occurrences fall in one of two distinct categories: (1) Claude-type, also present at Claude Extension and Dominic, with grades up to 6.7 g/t Au over 2 m (drilling intersect) and hosted in sheared and silicified fine-grained metasedimentary rocks with finely disseminated sulphides including arsenopyrite; or (2) Manuel-type, also present at Inex and Charles, with grades up to 75 g/t Au in grab samples and hosted in garnet- and sulphide-rich paragneiss. Although of higher Au grade, the latter type appears more discontinuous at present time. The primary control on Au mineralization appears to be the regional foliation that trends ENE to WNW locally, as in the Inex Zone area.

Exploration work for 2007 consisted in ground geophysics (IP, EM and Mag) along 173.9 line-kilometres, leading to the recognition of new anomalies. Follow-up sampling of the secondary environment including lake sediments, B-horizon soils and tills resulted in several anomalies that are progressively narrowed down. In 2007, two of these geochemical anomalies were explained by anomalous gold in bedrock. Lithochemical sampling and reconnaissance geological mapping led to the discovery of two significant gold occurrences in bedrock: the Charles and Dominic targets, as well as several other isolated showings. Mechanical stripping and channel sampling focused on the Manuel and Claude zones, leading to extension of known mineralization in both cases. Finally, a drilling program was completed in September-October to assess the Charles Target at depth and 3 geophysical targets of the Smiley Target area. Consequently, the 2007 exploration program generated several positive results which warrant further exploration work. A two-phase exploration budget of C\$1,800,000 is proposed, mainly for drilling of gold targets.

## **4. Introduction and Terms of Reference**

The present report provides a description of the general and geological setting of the Opinaca-Wildcat Au Project and describes exploration work carried out by Everton Resources Inc. (“Everton”). It is presented in compliance with National Instrument 43-101 and updates information released in the previous Technical Report (Girard 2006).

It is understood that this report will be used to provide disclosure to Everton’s Board of Directors and to support Everton’s future financing activities, and that it will be submitted to the TSX Venture Exchange.

The present report relies mainly on Everton’s exploration database completed with publicly available information on certain aspects as to the general geology and adjacent properties. The author has been involved in exploration work on most of these properties since 2006 as consulting geologist.

## **5. Reliance on Other Experts**

Land tenure information on mining claims was obtained from Everton Resources Inc. Also, the author relied on Miller, Thompson, Pouliot LLP, of Montréal, Québec, for legal aspects.

Historical work reported in this technical report is based on assessment files maintained by the *Ministère des Ressources naturelles et de la Faune* (MRNF) and, although the author has made every possible attempt to accurately report all the information contained in these files and maps, he cannot verify the accuracy or completeness of the obtained data. Also, the authors of these files might not all be qualified persons according to National Instrument 43-101. Nevertheless, these data remain appropriate and valid in assessing the mineral potential of the properties included in the Opinaca-Wildcat Project.

## **6. Property Description and Location**

The Project lies to the north and east of Opinaca Reservoir in the James Bay area of Québec (Fig. 1). During the year 2007, new claims were acquired, adjacent to the existing properties. The Opinaca-Wildcat Project now consists of twelve claim blocks for a total of 1505 map-designated claims (CDC) covering an area of 786 km<sup>2</sup> (Fig. 2). Individual claim blocks are described in Table 1. Appendix I lists the CDC number, location as row-column per map sheet, area (ha), expiry date and registered owner of each individual claim.

The intricate Opinaca and Wildcat groups of claims differ in their ownership as follows: the initial Wildcat claim blocks (#1 to 7) were purchased from Mr. Peter Bambic who retained a 1% NSR royalty. The Wildcat group is now 100% owned by Everton. In contrast, the Opinaca group is subject to an option agreement by which Everton may acquire 50% interest over five years. Specific conditions in relation to both acquisitions are detailed in the previous Technical Report (Girard 2006).

**Table 1.** Description of claim blocks.

<b>Claim block</b>	<b>Nb. of claims</b>	<b>Area (ha)</b>	<b>NTS map sheets</b>
Opinaca A	456	23,748.8	33C/9, 33C/16, 33B/12, 33B/13
Opinaca B	167	8,793.34	33B/12
Opinaca A East	43	2,237.96	33B/13
Opinaca B North	52	2,716.62	33B/12
Wildcat 1	148	7,722.67	33C/9, 33C/16
Wildcat 2	28	1,460.57	33B/12

Wildcat 4	125	6,551.52	33B12, 33B/5
Wildcat 5	131	6,850.69	33B/12
Wildcat 6	5	261.68	33B/12
Wildcat 7	144	7,541.36	33B/12, 33B/11
Wildcat 8	158	8,259.70	33B/11
<b>Total</b>	<b>1,505</b>	<b>78,600</b>	

## **7. Accessibility, Climate, Local Resources, Infrastructure and Physiography**

The Opinaca-Wildcat Project lies some 350 km north of Matagami and 110 km north of the Cree village of Nemiscau. The nearest road access is a gravel road, maintained year-round for the Opinaca spillway, some 20 km west of the western border of the property. This road belongs to Hydro-Québec and is connected to the paved road that links Matagami to Radisson. Except for claim blocks Wildcat 1 and Opinaca A, which can be accessed by boat via Opinaca Reservoir, the property is only accessible by helicopter or by float plane on large lakes. Bush plane services are accessible at km 372 along the James Bay road or at the Nemiscau Airport. Future road access to the property might be facilitated by the development by Opinaca Mines of the Eleonore deposit, located some 5 km southwest of the property.

The area is influenced by a temperate to sub-arctic climate, with short warm summers and harsh winters. Average summer temperatures range from 10 °C to 25 °C during the day to 5 °C to 15 °C at night, between June and September. Winters can be cold with

temperatures ranging from -60 °C to 10 °C. Precipitation varies during the year, reaching an average of 2 metres annually. The ground is generally free of snow from mid-June to October.

The area is surrounded by extensive hydroelectric facilities and associated infrastructure. The nearest power station, known as La Sarcelle, is located 45 km to the southeast. Cree communities also surround the project with the closest being Nemaska to the south, Eastmain to the southwest, and Wemindji to the west. The towns of Matagami, Chibougamau and Rouyn-Noranda are all mining towns with extensive services, accessible by the James Bay road.

The region includes many lakes and rivers. The landscape consists of rolling hills with altitudes ranging from 250 to 300 m above sea level. The area is drained westward, to Ell Lake, itself part of the Opinaca Reservoir. Vegetation is typical of taiga, including areas covered by an open forest of black spruce and jack pine, episodically devastated by wild fire.

## **8. History**

The Opinaca-Wildcat Project started with the acquisition of claims from two independent groups present in the area, as detailed under Item 6.

### **8.1 Historical exploration**

Significant historical exploration work is limited to the newly acquired Wildcat 8 claim block. In 2002, Maude Lake Explorations carried out till sampling transects down-ice from circular magnetic highs across a large area, some of which were located within the newly acquired Wildcat 8 claim block. These till samples were processed for the identification of diamond indicator minerals (Trudeau 2002).

### **8.2. Geological mapping**

Regional mapping was performed by the MRNF in NTS map sheet 33B (Simard and Gosselin 1999), and 33C/09 and 33C/16 (Remick 1976). These regional mapping surveys were followed with more detailed studies focusing on mineralization (Chartrand and Gauthier 1995, Gauthier and Larocque 1998, Moukhsil and Doucet 1998, Mouksil *et al.* 2007, Bandyayera and Fliszar 2007).

### **8.2. Lake sediment geochemistry**

A regional lake-bottom geochemical survey was carried out by the S.D.B.J. between 1973 and 1976 and reanalyzed in 1991 by the MRNF for 35 elements including Au, As and Cu (Beaumier and Kirouac 1995). All claim blocks included in the Opinaca-Wildcat Project were entirely covered in 1975 by this regional lake sediment survey.

## 9. Geological Setting

### 9.1. Regional geology

The Wildcat-Opinaca Project is largely underlain by rocks of the LaGuiche Group, included in the metasedimentary Opinaca Subprovince. The Wildcat 4 claim block straddles the contact between the metasedimentary Opinaca and volcanoplutonic LaGrande subprovinces, although it should be noted that the suture between these two subprovinces is not well-defined and typically shows gradational contacts. Migmatized paragneisses are the dominant rock type in the LaGuiche Group within the limits of the Project. Minor nodular paragneiss and quartz diorite are also observed.

### 9.2. Property geology

Most of the property is underlain by the thick metasedimentary pile of the LaGuiche Group (Fig. 3) consisting of biotite schist intensely intruded by quartzo-feldspathic pegmatite, and formerly referred to as paragneiss. A few intrusive rocks composed of granodiorite and tonalite (Simard and Gosselin 1999) occur to the south. A more detailed geological map of this area is soon to be released by the MRNF (Bandyayera and Fliszar, 2007) In 2005, IOS mapped most of the project area, except for claims blocks Wildcat 5 and 8, at a scale of 1:20,000 (Boudreault and Allou 2006).

### 9.3. Glacial geology

The area was influenced by two successive ice flows associated with two distinct ice spreading centres. The younger ice flow that is responsible for most glacial landforms is well represented on the glacial map of Canada (Prest *et al.* 1967). It runs WSW to SW due to the upward displacement of its ice flow center along the eastern border of the Labrador Trough. An earlier ice flow to the NW (290°-330°) is documented from striation marks on bedrock in the James Bay area of Québec (Paradis and Boisvert 1995, Veillette 1995, Veillette *et al.* 1999). It appears to be associated with a northeast-trending ice divide extending from Desmaraisville to the Tichegami Hills. Finally, this simple succession of ice flows combined with the predominance of glacial deposits in surficial sediments (Fulton 1995) favor the application of glacial indicator tracing in this area.

## 10. Deposit Types

The foremost deposit type that is likely to be found within the project area is Archean lode gold (Robert *et al.* 1997), either disseminated or vein-hosted. Two examples of this deposit type can be mentioned here: (1) the Roberto sediment-hosted disseminated gold deposit on the adjacent Eleonore project (Cayer *et al.* 2006, Simoneau *et al.* 2007) and (2) the Clearwater vein-hosted gold deposit (Eastmain Resources 2003) located southwest of the project area. Concurrent exploration tools, including geochemistry (lake sediment, till and soil sampling) and glacial indicator tracing, geophysics (IP, EM, Mag), lithochemical sampling (bedrock and boulders), geological and structural mapping, must be appropriately used with comprehensive interpretation.

## 11. Mineralization

Exploration work by Everton from 2005 to 2007 inclusively resulted in the discovery of several gold occurrences (Fig. 3 and Table 2) scattered across these properties (about 45 x 85 km). It is noteworthy that no gold mineralization was known before within the project area. The following description of gold mineralization is based on petrographic and mineragraphic studies of the main gold occurrences commissioned by the issuer (Renou 2007a, Renou 2007b) and on field observations recorded in Everton's database as well as core descriptions (Charbonneau and Lanthier 2007).

The many gold occurrences are discussed under two categories according to the main petrographic characteristics of the gold-bearing rocks. The first type includes the Claude, Claude Extension and Dominic showings. The second type is best observed at Manuel, where it was exposed by stripping and tested by channel sampling, but also characterizes the Inex and Charles zones, both investigated by drilling.

### 11.1. Claude-type

Gold occurs in a sheared and silicified metasedimentary rock with finely disseminated pyrrhotite and arsenopyrite. Auriferous intersects, grading from 2 to 6.7 g/t Au and locally associated with visible gold (hole OP-07-20) were obtained (see Item 13 below). Mineralization is associated with pervasive silicification and chloritization and minor sericitization, carbonatization and tourmalinization. The typical alteration sequence along core length is observed as follows: the country rock, a coarse-grained metasedimentary rock, goes from medium to fine-grained and is progressively silicified, carbonatized and sericitized while its biotite content is chloritized. Gold and finely disseminated pyrite are found in the core of these alteration zones. Intense chloritization associated with veining at a low core angle (10-20°) was observed but appears unrelated to Au. However, examination of assay results shows a clear correlation between Au and As values. A petrographic study of mineralized drill core from the first orientation drill hole OP-06-07 at Claude (Renou 2007a) reveals that gold deposition is associated with biotite replacement to chlorite and pyrrhotite replacement to pyrite and arsenopyrite at about 350°C, under retrograde conditions following peak metamorphism.

### 11.2. Manuel-type

This second type of mineralization is encountered at Manuel, Inex and Charles. Here, high-grade gold is closely associated with garnet- (10-30%) and sulphide-rich (5-20%) paragneiss forming elongated bodies enclosed in metasedimentary rocks of the LaGuiche Group. Gold precipitation appears to be associated with the presence of garnet and pyrrhotite (pyrite). In particular, gold grains are most frequently observed in fractures of individual garnet crystals (Renou 2007b), which suggests that Au deposition took place in openings associated with the brittle deformation of mineralized bodies. At Manuel, a gold-rich thin shear zone with sericite alteration extends beyond the paragneiss body and may have served as a channel for the ascent of hydrothermal fluids. Thus, petrological and mineragraphic observations suggest that gold precipitation took place well after the appearance of garnet and sulphides in specific metasedimentary units.

**Table 2.** Main gold occurrences found since 2005 on the Opinaca-Wildcat Project.

<b>Name</b>	<b>Description</b>	<b>Assay results</b>
Inex	Opinaca A extending into Wildcat 2, 6 drill holes, gold in garnet- and sulphide-rich paragneiss.	Surface samples up to 29.07 g/t Au. Best intersects: 1.46 g/t Au over 4 m (hole OP-06-03) and 9.03 g/t Au over 0.6 m (hole OP-06-02).
Manuel	Wildcat 5, in garnet- and sulphide-rich paragneiss.	Up to 29.20 g/t Au in grab samples and 12.0 g/t Au over 4.6 m in channel samples. See text for description.
Manuel Extension	Located 500 m east of the main Manuel occurrence	75.79 g/t Au (grab sample) associated with finely disseminated pyrrhotite.
Claude	Opinaca B, silicified metasedimentary rock with disseminated sulphides, 13 drill holes.	Surface showing: 5.62 g/t Au. Best intersects: 1 g/t Au over 21 m (hole OP-06-07), 6.7 g/t Au over 2 m (hole OP-07-11).
Charles	Northern part of Opinaca A, in garnet- and sulphide-rich paragneiss.	Surface samples up to 35.9 g/t Au. Best intersect: 2.7 g/t Au over 2 m (hole AC-07-01).
Dominic	Opinaca B, silicified metasedimentary rock with disseminated sulphides.	Surface samples up to 6.1 g/t Au.

### 11.3. Geological controls

The main structural control appears to be the dominant foliation in the metasedimentary rocks which trends east-northeast, except in the Inex area where it is west-northwest (MIR inc. 2008). This trend corresponds to the preferential orientation of biotite in the metasedimentary rocks, as well as the trend of omnipresent tabular or lenticular pegmatite intrusions. Distinct rock bodies of garnet- and sulphide-rich paragneiss or amphibolite mostly form lenses also aligned along this dominant trend. A series of showings aligned along these structures form kilometre-scale corridors such as the Inex Zone or the Claude-Manuel Corridor hosting the Claude Extension and Dominic gold occurrences. These trends form high-priority targets, intensely explored by Everton.

## 12. Exploration

Exploration work performed in 2007 by Everton on the Opinaca-Wildcat Project includes: ground induced polarization and magnetic surveys, follow-up till sampling, pedogeochemical B-horizon sampling, lithogeochemical sampling, stripping and channel sampling (Table 3). Previous exploration performed in 2005 and 2006 by Everton is described in a previous 43-101 Technical Report (Girard 2006), whereas drilling is

described under Item 13 below. Exploration work in 2007 was conducted under the supervision of Gilles Lanthier, P.Geo., acting as the Qualified Person in charge of Exploration in Québec for Everton Resources Inc.

**Table 3.** Exploration work conducted by the issuer on the Opinaca-Wildcat Project in 2007.

Claim block	Lake	Till	B horizon	Lithogeochemistry		Described outcrops	Geophysics (line km)
	sediment			Boulder	Outcrop		
Opinaca A		58		52	346	1403	125.7
Opinaca B		55		97	550	1194	48.2
Opinaca A East							
Opinaca B North		32		11	3	2	
Wildcat 1		42		27	41	224	
Wildcat 2		19		6	9	117	
Wildcat 3		9	543	28	12	13	
Wildcat 4		10		5	16	22	
Wildcat 5		44		18	79	252	
Wildcat 6							
Wildcat 7		18		23	92	481	
Wildcat 8	95			32	96	604	
TOTAL	95	287	543	299	1244	4312	173.9

Lake sediment = number of lake sediment samples taken in 2007

Till = number of till samples taken in 2007

B horizon = number of pedogeochemical B-horizon samples taken in 2007

Geophysics = ground geophysics combining IP and Magnetic in line-kilometres surveyed in 2007 and early 2008.

### 12.1. Ground geophysics

Several conductors, and chargeability and magnetic anomalies were detected or confirmed in the course of ground IP and magnetic geophysical surveys carried out in 2007 and early 2008 (Fig. 4). Drill-testing of some chargeability anomalies in 2007 confirmed the presence of disseminated pyrrhotite but failed to detect significant gold. These ground geophysical surveys were conducted on cut grids at a 100 and 200-m line spacing for a total of 173 line-kilometres. Most of this work was performed on the Smiley Target and the Charles, Claude and Manuel zones on Opinaca A and B (Fig. 4). Géophysique TMC and Abitibi Geophysics of Val-d'Or were alternately commissioned by Everton to complete the geophysical measurements along grid lines set up by Everton technicians. The geophysical data was also submitted to G. Lambert of Rouyn-Noranda, Québec for further interpretations.

### 12.2. Lake sediment geochemistry

Lake sediment geochemical sampling for 2007 was limited to the more recently acquired Wildcat 8 claim block in the easternmost part of the project area (Fig. 5). This survey returned several weak Au anomalies (>2 ppb Au) locally associated with Ba, Bi or Mo

(Fig. 5). Lake sediment, more specifically referred to as gyttja, was collected from the deepest part of lakes using a torpedo sampler launched from a float-mounted helicopter. Small and medium-sized lakes were sampled at a spacing of 1 to 2 kilometres between sampled lakes. Samples were dried, sieved and split, then submitted for analysis by different methods including INAA and ICP-MS. Logistics, sampling, sample processing and data processing were provided by *IOS Services géoscientifiques* of Saguenay, Québec.

### **12.3. Pedogeochemical (B-horizon) program**

Pedogeochemical sampling was limited to the Wildcat 3 claim block (Fig. 5) in 2007. Some gold anomalies were revealed, which confirm and constrain the Au signals detected during the 2006 regional till survey. Prospecting follow-up on these anomalies led to the discovery of a gold-bearing boulder (1.3 g/t Au) where mineralization consists in pyritized quartz veins in metasedimentary rock and of a nearby occurrence of dense garnet amphibolite anomalous in gold (620 ppb Au). The 2007 program consisted in 542 samples of the B-horizon of soils developed in glacial sediments. Samples were taken using an auger at every 100 m along north-south transects spaced every 400 m. About 400 g of soil were taken in kraft-paper bags, then dried and shipped for sieving and analysis by ALS-Chemex of Val-d'Or. This short sampling program was conducted by Everton staff.

### **12.4. Till sampling**

Follow-up till sampling completed in 2007 returned positive results for 7 of the 11 auriferous till occurrences previously revealed during a regional survey (Girard 2006). These positive follow-up results confirm the presence of anomalous Au, along with other accompanying elements in till (As, Sb, Mo, Co and Bi) and further constrain their provenance area. The 4 negative results failed to repeat Au anomalies or produced very low Au values that cannot allow glacial tracing to the bedrock source. For the purpose of this follow-up program, the anomalous sampling sites were revisited and re-sampled, and closely spaced till sampling transects were drawn perpendicular to local ice flow. The samples, 15 kilograms each, were processed by Explo-Lab of Val-d'Or for the extraction of the dense mineral fraction, which was then submitted to ALS-Chemex of Val-d'Or for Au and multi-element analysis. Duplicates of auriferous till from the 2006 regional survey were also taken and processed independently for confirmation of results. Till sampling in 2006 and 2007 was completed by Everton staff, following a detailed planning program prepared by Inlandsis Consultants s.e.n.c. of Montréal.

### **12.5. Lithogeochemical sampling**

During the summer of 2007, a total of 1876 lithogeochemical samples were taken from boulders and outcrops (Fig. 6) along prospecting transects, completed across selected parts of the project area. These led to the discovery of several new gold occurrences in bedrock namely, (1) the Charles Target grading up to 35.9 g/t Au in sulphide- and garnet-rich metasedimentary rock, and (2) the Dominic Target with three significant values of 6.1 g/t Au, 4.5 g/t Au and 1.7 g/t Au in a pyritic, silicified metasedimentary rock. These two significant occurrences of gold mineralization in bedrock are additional to those already found in 2005 and 2006, namely the Inex, Manuel and Claude zones (Girard

2006). In addition to these significant gold occurrences, a few values of more than 1 g/t Au were also discovered in various sectors of the project area, and have yet to be fully investigated by future exploration work (Fig. 6). In addition, two transects targeting anomalous gold in glacial sediments resulted in the discovery of garnet amphibolite with anomalous gold content. The latter may represent a new type of gold mineralization and thus requires additional work. All 2007 prospecting was carried out under the supervision of Gilles Lanthier and partly executed by Everton staff and contracted to GL Geoservices of Rouyn-Noranda. Crushing and analysis of lithochemical samples was submitted to Lab-Expert of Rouyn-Noranda.

### 12.6. Stripping and trenching

The use of a hydraulic mini-excavator allowed exposures of bedrock for description and sampling over a total linear length of about 700 metres (Table 4). This exploration work was performed to test geophysical and geologic targets surrounding the Claude and Manuel zones and led to the discovery of a new series of gold showings (up to 5.84 g/t Au) immediately north of the Claude Target, where subsequent channel sampling returned 2.37 g/t Au over 0.5 m. This work was undertaken by Everton staff under the supervision of Gilles Lanthier, P.Geol.

**Table 4.** Description of 2007 trenching on the Opinaca-Wildcat Project.

Trench#	Sector	Length (m)	Number of samples	Grab sampling results	Channel (m)	Sampling intersect
TR-OP-B-01	Claude SW	40	18			
TR-OP-B-02	Claude SW	15	9			
TR-OP-B-03	Claude SW	25	32

## 13. Drilling

To date, a total of 34 drill holes were completed within the project area (Fig. 7, Table 5). The best results were obtained in the Claude Target area, where Au mineralization accompanied with intense silicification was traced over a strike length of 350 m (Fig. 8). Other tested zones (Inex, Charles) returned lower grades or discontinuous mineralization, while two surface zones (Manuel and Dominic) remain untested by drilling (Fig. 7). Since drilling is still at an exploration stage, intersections are reported along core length, without any correction for true width.

**Table 5.** Summary of drilling programs by Everton on the Opinaca-Wildcat Project.

Year	Month	# ddh	Length (m)	Zone tested with best Au intersection
2006	August-Sept	8	1045	Claude Target (1 hole): 4.6 g/t Au over 2 m Inex Zone (6 holes): in OP-06-03, 1.46 g/t Au over 4.0 m Claude Extension Zone (1 hole)
2007	March-April	14	2625	Claude Target (12 holes): 6.73 g/t Au over 2.0 m Claude Extension Zone (2 holes)
2007	September	12	1400	Charles Target (8 holes): 2.7 g/t Au over 2.0 m Smiley Target (3 holes) and Opinaca B North (1 hole)
2008	March-	-	-	In progress

The two drilling programs carried out in 2007 targeted mainly the Claude and Charles gold occurrences (Table 6 and 7). Prior to this work, only a short sampling program (8 holes) had taken place in 2006, targeting the Inex, Claude and Claude Extension zones (Girard 2006). These drilling campaigns confirmed the Au potential of the project particularly at Claude where a fairly continuous Au mineralized zone with disseminated sulphides and intense silicification was delineated. In contrast, Au mineralization was confirmed at Charles but appears of lower grade and less continuous. Other holes targeting IP anomalies in the Smiley Target area, a conductor axis on the Opinaca B North claim block and surface showings at Claude Extension did not return any significant Au values. Several prospective targets remain, some of which are currently being drilled.

**Table 6.** Drilling results for the Claude Mineralized Zone

Hole #	From (m)	To (m)	Length (m)	Au (g/t)
OP-07-09	33.5	35.5	2	1.01

	169.6	177	7.4	0.5
	212.2	218.5	6.3	0.8

Drilling for 2007 was contracted to Chibougamau Drilling Inc., and executed with a heliportable rig, BTW in diameter. These campaigns were supervised by G. Lanthier, P.Geo., Exploration Manager for Québec for Everton. with the cooperation of the author (Rémi Charbonneau) of Inlandsis Consultants and Guillaume Joyal, P.Geo. of Everton.

Lodging was provided at Everton's base camp on the shore of the Opinaca River. Daily transportation of crew members was also done by helicopter. Drill hole locations were determined on surveyed cut lines and deviation measurements were done using the Flexit™ system. Lake-based holes were all cemented before moving to the next site.

Drill core was transported to Everton's camp for descriptive logging and sampling. Systematic splitting and sampling was applied to the entire core length. A sample spacing of 1 metre was generally applied although a closer spacing of 0.5 m was used for intensely mineralized sections. Samples were transported to LabExpert of Rouyn-Noranda for crushing and analysis for Au by fire assay on 30 g plus determination of 33 additional elements by ICP-MS.

## **14. Sampling Method and Approach**

Similar sampling methods were applied to both rocks and sediments. Whenever possible, the sampling site was flagged and clearly marked in the field with the sample number for eventual future visits. The sample was described and identified with the use of pre-numbered sampling booklets provided by the analytical laboratories. A sample description and the site location, obtained from a handheld GPS, were noted on the sampling pad under the corresponding sample number.

Till samples consist in large volumes (10-20 litres) needed for gravity concentration of the dense mineral fraction. Till transects and individual sampling sites were planned from air photo interpretation. Specific features such as the local topography, along with physical, textural and structural characteristics of the sediments were taken into account in the description of each till sample.

Lithochemical samples were collected in the course of geological mapping transects from potentially auriferous or mineralized rock types, either from outcrops or boulders. A typical weight of about 1 kilogram is necessary at the laboratory to produce a homogeneous pulp after crushing. Sample descriptions included lithology, structural measurements, mineralogy, mineralization and alteration.

Positive samples were visited for a detailed re-sampling which allowed the confirmation of sampling site locations and sample descriptions. The same lithology was re-sampled, along with adjacent rock types and surrounding mineralization. If necessary, channel sampling was performed for a better representation, especially for Au or coarse-grained mineralization.

## **15. Sample Preparation, Analyses and Security**

The samples were securely packed, clearly identified and promptly shipped to the laboratory for analysis. Private transport was favoured to ensure security and quick delivery to the laboratory. The appropriate processing and analytical methods were indicated to the laboratory. The analytical methods favoured by Everton are as follows:

- Fire assay for Au on 30 g
- ICP-MS for multi-element packages following multi-acid total digestion
- XRF for whole-rock major oxide determinations

Higher detection levels for base metals can subsequently be obtained from reanalysis of the pulp.

## 16. Data Verification

Systematic re-sampling was applied to any elevated values obtained from the laboratory. This measure allowed the confirmation of the sample location, description and reproducibility of the analytical results. However, this method is not sufficient in itself to confirm the validity of the overall geochemical database. This was achieved through the introduction of duplicates, analytical blanks and standards (Table 8). The analytical results of these standard materials show absolute variations within 40 ppb for Au and relative variations of 1-5% for other elements. Obviously, the relative variation increases whenever natural concentrations approach detection limits.

**Table 8.** Standard materials submitted for analysis (example from Sept.-Oct. 2007 drilling campaign).

In addition, the author was involved in a re-sampling program on positive exploration results for Everton in 2007. In every instance, the sampling sites were easily found in good accordance with field descriptions, allowing quick re-sampling of the mineralized rock. Most positive results were confirmed, with some exceptions that can be attributed to a nugget effect or defects in sample processing or analytical processes.

## 17. Adjacent Properties

**The information contained in this section was collected but cannot be verified and corroborated by the author. It is not necessarily indicative of the mineralization present on the properties included in the Opinaca-Wildcat Project.**

Intensively active exploration projects are presently taking place in the area, following the discovery of the Eleonore deposit by Virginia Gold Mines (Cayer *et al.* 2006), some 3 km from the property limits. All the ground is currently staked. Since April 1, 2006, Goldcorp, through its subsidiary Opinaca Mines Ltd, took over the management of the Eleonore project and has completed 298 diamond drill holes totalling 102 km allowing SRK Consulting to estimate an indicated gold resource of 1,834,900 ounces at 7.40 g/t Au (Simoneau *et al.* 2007).

Other companies with active exploration projects include Golden Valley Mines and Sirios Resources (Shark and Chechoo projects), Beaufield Consolidated Resources (Opinaca and Opinaca West properties) and Virginia Mines (Eleonore Regional Project). Press releases of these companies have been reviewed and reveal many new gold occurrences in surrounding areas. In particular, Eleonore South, a three-way joint venture between Eastmain Resources (operator), Opinaca Mines Ltd, and Azimut Exploration Inc. returned a significant gold occurrence referred to as the JT Target some 12 km southeast of the Roberto Zone, near the Wildcat 3 claim block. The JT Target Area returned channel sampling intersects up to 5.33 g/t Au across 8.0 m (press release dated February 26, 2008) and is currently being drilled (Eastmain Resources press release dated March 20, 2008).

## **18. Mineral Processing and Metallurgical Testing**

No metallurgical study of mineralization located within the project area has been commissioned by Everton.

## **19. Mineral Resources and Mineral Reserve Estimates**

The properties have not been subject to any resource calculations.

## **20. Interpretation and Conclusions**

Since the start-up of exploration by Everton Resources in 2005, the Opinaca-Wildcat Project has continuously produced new gold occurrences. At this point, follow-up exploration work by (1) drilling at Inex, Charles and Claude Extension or (2) channel sampling at Manuel, reveal moderate grades or poor continuity while (3) drilling at Claude was successful in tracing an auriferous zone over a strike length of 350 m. Although these results are below economic thresholds, many promising targets are still untested and wide areas of the project remain poorly explored, even at a reconnaissance level (*e.g.* Wildcat 8 claim block). Promising targets include the recently discovered Dominic Target, several IP and EM anomalies from 2007 ground surveys, geochemical Au anomalies in glacial deposits where provenance areas are progressively narrowed down (Wildcat 1 in particular) and extensive alteration zones typical of gold mineralizing hydrothermal systems, namely southwest of the Claude Target. Accordingly, the Opinaca-Wildcat Au Project clearly warrants further exploration work.

## 21. Recommendations

It is recommended to pursue the winter program that is currently taking place, with an allocated budget of C\$1,105,000 (Table 9). A subsequent exploration program is proposed for the summer of 2008, with a non-contingent first phase of C\$675,000 (Table 10). These exploration programs will consist in the completion of reconnaissance lithochemical sampling over the entire property with emphasis on recently available structural interpretation, alteration, geophysical and geochemical data. Conditional on the success of Phase I in generating significant exploration targets, a Phase II exploration program should be implemented with a supplementary operating budget of C\$1,125,000 (Table 10). This second phase will consist in appropriate follow-up on new gold occurrences in the form of stripping, channel sampling and drilling.

**Table 9.** Budget allocated by Everton to its ongoing winter 2008 exploration program.

Opinaca Block A	Details			Cost

## 24a. Certificate of Authors

I, Rémi Charbonneau, residing at 7667 Chateaubriand Avenue, Montreal, Quebec, hereby certify that:

I am presently an Associate of Inlandsis Consultants s.e.n.c. located at 7667 Chateaubriand Ave., Montreal, Quebec, H2R 2M2.

I received a B.Sc. in Geology from the University of Montreal in 1986 and a Ph.D. degree in Glacial Geology in 1995 from the same institution. I have been working as a geologist in mineral exploration since 1995.

I am an active Professional Geologist presently registered to the board of the *Ordre des Géologues du Québec*, permit # 290.

I am a Qualified Person with respect to the Opinaca-Wildcat Project in accordance with the specifications described in section 1.1 of National Instrument 43-101.

I have been involved since 2006, while working for the Issuer, with the properties that are the subject of the Technical Report entitled “Technical Report on the Opinaca-Wildcat Project” prepared for Everton Resources Inc.

As of the date of this Certificate, to the best of my knowledge, information and belief, the Technical Report contains all scientific and technical information that is required to be disclosed to make the technical report not misleading.

I fulfill the requirements set out in National Instrument 43-101 for an “independent qualified person” relative to the issuer.

I visited most of the Project Area during the summer of 2006 and 2007 while working for Everton Resources Inc.

I have read and used National Instrument 43-101 and Form 43-101F1 to make the present report in accordance with its specifications and terminology.

I consent to the filing of the Technical Report with any stock exchange and other regulatory authority and any publication by them for regulatory purposes, including electronic publication in the public company files on their website accessible by the public, of the Technical Report.

## 24b. Date and Signature

March 31, 2008

<< Rémi Charbonneau >>

Rémi Charbonneau,  
Geologist, Ph.D., OGQ member #290

## 25. Additional Requirements

There are no additional requirements regarding development and production plans for this Project in the near future.
